

Study Title			
Oral ixazomib, Lenalidomide, and Dexamethasone for Multiple Myeloma			
METHODS			
Study Design	Double-blind, placebo-controlled, phase 3 trial		
Inclusion Criteria	<ul style="list-style-type: none"> <li>Adult patients with relapsed AND/OR refractory multiple myeloma</li> <li>Measurable levels of disease</li> <li>ECOG = 0-2</li> <li>1-3 prior therapies</li> <li>Adequate hematologic/hepatic function, renal function <math>\leq 30</math> mL/min</li> </ul>	Exclusion Criteria	<ul style="list-style-type: none"> <li>Peripheral neuropathy (1 with pain or &gt;2)</li> <li>Refractory to prior lenalidomide therapy or proteasome inhibitor-based therapy (primary refractory disease eligible)</li> </ul>
Treatment	<ul style="list-style-type: none"> <li>1:1 ratio of treatment to control</li> <li>28-day cycles, 4 mg of oral ixazomib OR placebo on days 1, 8, and 15</li> <li>25 mg of oral lenalidomide on days 1 through 21</li> <li>10 mg for patients with CrCL <math>\leq 60</math> OR <math>\leq 50</math> mL/40 mg of oral dexamethasone on days 1, 8, 15, 22</li> </ul>		
Randomization	Stratified according to: <ul style="list-style-type: none"> <li># of prior therapies (1 vs. 2 or 3)</li> <li>Previous exposure to proteasome inhibitors (not exposed vs. exposed)</li> <li>International Staging System disease stage (I or II vs. III)</li> </ul>		
Details	<ul style="list-style-type: none"> <li>Treatment continued until disease progression/development of unacceptable toxic effects</li> <li>Thromboprophylaxis was required in all patients (97% ixazomib, 98% placebo)</li> <li>Dose adjustments for toxic effects permitted</li> </ul>		
Assessment	Response to study regimen was performed every cycle until disease progression.		
RESULTS			
Patient Population	<ul style="list-style-type: none"> <li>722 patients at 147 sites in 26 countries</li> <li>August 28, 2012, to May 27, 2014</li> <li>Baseline characteristics were well balanced between the study groups</li> <li>Cytogenetic analysis available for 76% of patients [19% = high-risk cytogenetic abnormalities, 10% with del(17p)]</li> </ul>		
Efficacy	<b>Treatment Group</b>	<b>Control Group</b>	
Primary End Point: <i>Progression-free survival</i>	<ul style="list-style-type: none"> <li>Median: 20.6 months (HR = 0.74; CI – 95%, 0.59 – 0.94, P = 0.01)</li> <li>Overall rates of response: 78.3%</li> <li>Complete response + very good partial response = 48%</li> <li>Median time to response: 1.1 months</li> <li>Median duration of response: 20.5 months</li> </ul>	<ul style="list-style-type: none"> <li>Median: 14.7 months</li> <li>Overall rates of response: 71.5 %</li> <li>Complete response + very good partial response = 39%</li> <li>Median time to response: 1.9 months</li> <li>Median duration of response: 15.0 months</li> </ul>	
	Median follow-up ~23 months, median overall survival has not been reached, follow-up is ongoing		
Safety	<ul style="list-style-type: none"> <li>SAEs: 47%</li> <li>Death: 4%</li> <li>AE <math>\geq</math> grade 3 severity: 74%</li> <li>Thrombocytopenia: Gr 3: 12%, Gr 4: 7%</li> <li>Discontinue: 62% (disease progression 34%, AE 17%)</li> </ul>	<ul style="list-style-type: none"> <li>SAEs: 49%</li> <li>Death: 6%</li> <li>AE <math>\geq</math> grade 3 severity: 69%</li> <li>Thrombocytopenia: Gr 3: 5%, Gr 4: 4%</li> <li>Discontinue: 63% (disease progression 40%, AE 14%)</li> </ul>	
CONCLUSIONS	Significantly longer (35%) progression-free survival by adding ixazomib (median duration ~6 months); additional toxic effects were limited. Overall survival benefit not yet shown. No adverse effect on QoL. May improve prognosis for patients with high-risk cytogenetic features (usually associated with poor prognosis) by lengthening the progression-free survival similar to those with standard-risk cytogenetic features. Responses were rapid and durable, and deepened with increasing duration of treatment. An increased focus on continuous therapy requires regimens that have acceptable side-effect profiles, that allow QoL to be maintained, and that are easy to administer. Almost half the patients had received treatment for at least 18 cycles at the 23-month analysis. All-oral ixazomib regimen was as simple and convenient for patients to follow as the placebo regimen.
